### Successfully introduce FL2215 variety which can be grown in Wet Season

Yield / ha in Wet season is 19.5- 20 tons/Ha

Yield / ha in Dry season is 20.5- 22.5 tons/Ha

- MARD already approved FL2215 for commercial production in Central Highlands
- FL2027: trial in another region in Vietnam is requested for an approval of commercial production

### New Development and Challenge

- A Trial of Wet season 1 using FL2215 in May and June (totally new window of planting in the rainy season) has been carried out successfully with an average yield of 19.7 tons a Ha
- Sprout inhibitor trial and registration
- Introduce one new variety into farming system every two years
- Could we leverage the testing results from other countries who already used the chemicals, and only test the difference, which might be interfered by geographical and demographical factors?
- Shorten the registration process for varieties, which produced by the enterprises who also make contract with farmers on production and consumption.
- Farmer template contract publicity
